Senior Software Engineer at Wells Fargo building applied-AI and distributed backend systems for a fixed-income trading desk. Recent work spans a machine-learning bond recommendation engine with an LLM assistant, and a rebuild of the desk's real-time PnL platform. That rebuild made queries roughly 3x faster and brought calculation latency down by two-thirds. Recipient of Wells Fargo's Top Achievers Award (roughly the top 1% of employees).

EXPERIENCE

Senior Software Engineer | Wells Fargo, Bengaluru

Jan 2026 – Present

- Building a machine-learning recommendation engine that surfaces the most relevant bonds for each institutional client from a daily sheet of 500–800 offerings. Rankings are validated in offline backtesting on historical trades. Own the learning-to-rank models (XGBoost), the feature pipeline, and an LLM assistant traders use to explore similar bonds and give feedback that improves future recommendations.
- Shipped historical rerun support for the PnL service using async Camel routes over MongoDB and Kafka. Corrections to past positions now recompute and persist under the correct historical date without republishing into the live trade stream.
- Led a performance investigation into slow PnL calculations, benchmarking each service route to isolate the bottleneck. Reworked request throttling and load distribution in the calculation path, cutting end-to-end p95 latency by 66%.
- Hardened the PnL reporting pipeline against upstream data changes. An internal mapping layer replaced fragile direct dependencies, and fail-fast integrity checks now catch bad data before it reaches desk reports.

Software Engineer | Wells Fargo, Bengaluru

Jul 2022 – Dec 2025

- Designed and prototyped a natural-language interface to MongoDB that turns plain questions into safe queries. Orchestrator and validator LLM agents (LangGraph, tool access via MCP) run retrieval-augmented generation over schema and user-context vector stores. Guardrails mask PII and block unsafe queries before anything runs.
- Extended the Java Spring Boot PnL microservices to a new asset class: expected cash-flow models, EUR FX conversion, swap-position roll-ups, and risk-factor attribution. Released with production Kafka topics and regression sign-off.
- Rebuilt the real-time PnL read path on MongoDB, replacing view-based reads with aggregation pipelines and compound indexes. P95 read latency dropped from around 710ms to 230ms with no loss of accuracy.
- Created a reusable activity-tracking layer adopted by two trading-desk teams across six service flows and eight repositories. It emits run status with correlation IDs, and its non-blocking design means monitoring can't block the business flow.
- Automated regression testing across 150+ financial scenarios with parallel execution and Splunk telemetry, reducing run time by 60%.
- Drove the migration of 10+ services onto OpenShift with rebuilt CI/CD pipelines.
- Delivered an asset-backed-finance reporting feature end to end on an investment-banking platform: an ingestion engine for Excel deal and pricing sheets, plus the schema migrations and reference-data reconciliation behind it.

Technology Intern | Wells Fargo, Bengaluru

May 2021 – Jul 2021

- Prototyped a time-series forecasting engine for ATM cash optimization, benchmarking SARIMA, LSTM, and Prophet across 111 ATMs with holiday and weather signals, reaching about 91% accuracy on weekly forecasts.

EDUCATION

B.Tech, Computer Science and Engineering | National Institute of Technology (NIT) Calicut, CGPA 8.55

2018 – 2022

TECHNICAL SKILLS

Languages: Python, Java, SQL

AI/ML: LLM agents and agentic RAG (LangGraph, LangChain, MCP, Claude, Llama), Recommender systems and learning-to-rank (XGBoost, PyTorch), Feature engineering, Embeddings and vector search (FAISS), Vector databases, Prompt engineering, Model evaluation, AI guardrails and PII masking

Backend: Distributed systems, System design, Microservices and event-driven architecture, Apache Kafka, Spring Boot, MongoDB, Redis (distributed caching), REST APIs, Concurrency and multithreading, Performance engineering

Financial Domain: Fixed-income trading, PnL and pricing systems, DMN rules engines, Trade lifecycle

Cloud Infrastructure and CI/CD: OpenShift, Kubernetes, Docker, GitHub Actions, Splunk, Observability

PUBLICATIONS & AWARDS

Publication: SaBMOGWO-S, a feature-selection algorithm evaluated on 21 benchmark datasets. *The Journal of Supercomputing* (Springer), 2023, Vol. 79 (co-author). DOI: 10.1007/s11227-023-05145-y.

- **Top Achievers Award, 2025:** Wells Fargo's highest individual recognition, for sustained high-impact delivery across PnL and GenAI work.
- **Top Innovator, Innovation Pitch Day 2024:** top 4 of 600+ firm-wide entries, for a natural-language database assistant.
- **Manager Spotlight Awards (×3):** awarded in three consecutive years for consistent ownership and delivery.
